CASES BY RACE/ETHNICITY

CASES BY GENDER

Number of COVID-19 Cases by Gender in Bridgeport Since April 6, 2022

SUMMARY

Cases of COVID-19 continue to trend downwards through the month of October, maintaining numbers similar to those seen in June 2022. There has been a dip in daily cases reported over the past 2 weeks as well, but this may be due to a lag in reporting rather than a real decrease. The bi-weekly incidence rate remains at the lowest levels seen since June 2022 as well. The seven-day average of cases has also trended downward since September and the COVID-19 case numbers remain lower than what was seen in the previous two years. We are expecting to see an increase in cases over the winter, as was seen previously, but going into this season with a lower number of cases is an improvement.

The percent of positive tests continues to bounce around ranging from a low of 6% to a high of 14% since early September and the number of tests administered continues to fall slowly. These two factors combined suggest that while fewer tests are being taken, they are more often being taken by symptomatic individuals and the home tests are not always being reported.

20-39 year olds remain the age group with the highest number of COVID-19 cases in Bridgeport, but all age groups have seen a decline in new cases this reporting period. When examined by zip code, 06606 continues to have the highest number of cases and 06607 the lowest number of cases. Individuals identifying as Hispanic or Black bear the highest burden of COVID-19 cases at a level disproportionate to the population demographics of Bridgeport. Finally, females had a lower number of new COVID-19 cases than males did, which has not been the case since August.
